Disorders of Skin Color

Vitiligo

Definition:

- It's an acquired loss of pigment of the skin.
- It usually begins in childhood. Usually < 30.
- It affects both sexes.
- It occurs in all races.

VITILIGO
Absence of Melanin
Melanin
Melanocyte
Disappearence of melanocyte
interrupt the production of melanin

Aetiology:

unknown. Multi-factorial disorder

1- Inheritance.

2- Autoimmune destruction of melanocytes.

3- Neurogenic theory

Clinical picture

Well defined depigmented (**milky white**) patches surrounded by a normal or a hyperpigmented border. The hair in vitiliginous areas usually become white

Site:

- Any site can be involved.
- Vitiligo may involve the entire body surface.
