What is Melasma?

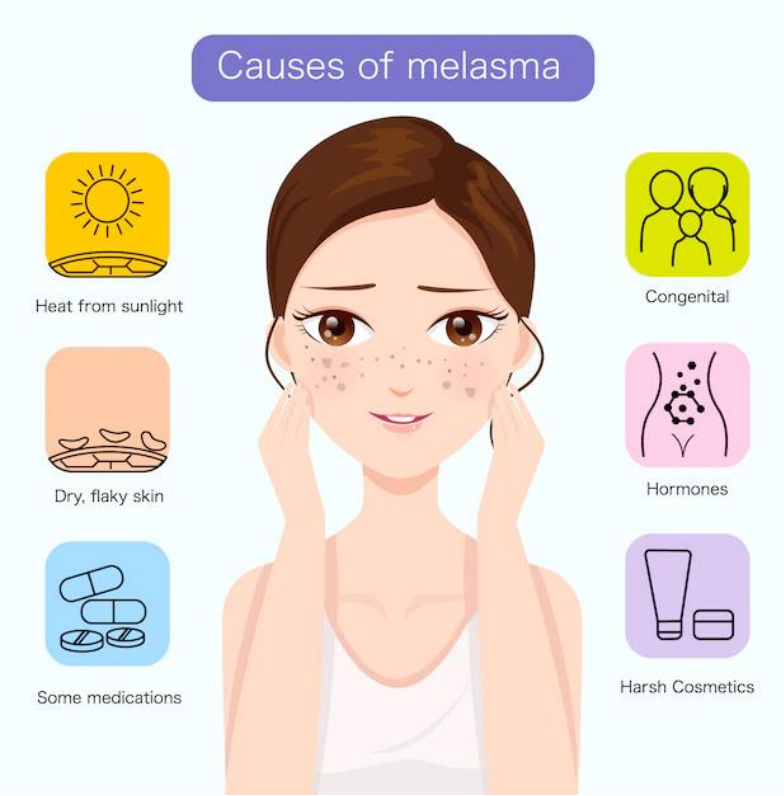

Melasma

- Definition: a benign disorder characterized by hyperpigmentation of the skin that is associated with pregnancy and oral contraceptive use .
- It is a common acquired skin disorder that presents as a bilateral, blotchy, brownish facial pigmentation.

Epidemiology

- Common in dark-skinned individuals.
- Incidence in ♀ > ♂

- Etiology
  1. Pregnancy: referred to as “mask of pregnancy
  2. Hormonal contraceptives
  3. Neoplastic diseases that produce hormones.

Common Triggers for Melasma

Skin tone

Increased estrogen hormones

Pregnancy

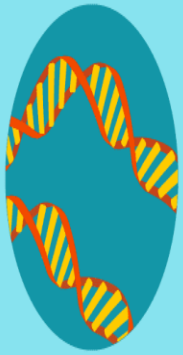

Sun exposure

Skin inflammation

Certain drugs

Genetics

verywell

Clinical features :

- Hyperpigmented lesions on the face.
- Exacerbated by exposure to sunlight (UV radiation) .
- Melasma presents as bilateral, asymptomatic, light-to-dark brown macules or patches with irregular borders.

Distinct patterns include:

1. Centrofacial : forehead, cheeks, nose, upper lip ; 50-80% of presentations.

2. Malar : cheeks, nose.

3. Mandibular : jawline, chin.

Diagnosis:

Clinical diagnosis
